CCR5 serves as a co-receptor for infection by macrophage-tropic (M-tropic) strains of HIV-1. Individuals the macrophage-tropic (M-tropic) strains of HIV-1. Individuals infection, but heterozygous individuals are susceptible. The infection, but heterozygous individuals are susceptible. The invention additionally relates to the identification of variant CCR5. The detection of CCR5 variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AIDS. Probes and primers (see AAW84127-35) are provided for use in method is provided for inhibiting HIV-1 infection of a ceil expressing the CCR5 receptor. This involves introducing a nucleic acid encoding a CCR5 molecules present on the cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MDYQVSSPIYDINYYISEPCQKINVKQIAARLLPPLYSLVFIFGFVGNMLYILILINCKR 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                   The present sequence is an inactive human CC (Cys-Cys) chemokine receptor 5 (CYS5), which lacks the last 3 transmembrane regions and the regions involved in G protein-coupling. CCR5 or its CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatorid arthritis, qionerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2) infection, cancer, atheroscierosis and autoimmune disorders. Subjects that express the inactive receptor have a predisposition, or resistance to HIV-1 and/or HIV-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CCR5; CCR5-delta32; co-receptor; infection; diagnosis; AIDS;
                                    Active and inactive forms of human CC chemokine receptor CCR-5 useful to diagnose, prevent and/or treat inflammatory disorders,

                                                                                                                                                                                                                                                                                                                                                                          The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RANTES chemokines, but not by monocyte chemoattraatant protein 1 (MCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines. Active CCR-5 is also a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, growth glomerulonephiritis, asthma, idlopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders.
                                                                                                                                                                                                                                                                                    Active and inactive forms of human CC chemokine receptor CCR-5 . useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chemokine receptor 88C; atherosclerosis; rheumatoid arthritis; tumour; asthma; viral infection; AIDS; inflammation; autoimmune disease; therapy; diagnosis; leukocyte trafficking;

                                                                                                                                                                                                                                                                                                                                                      The present sequence is an inactive human CC (CVs-CVs) chemokine receptor 5 (CCR5), which is not a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or tits CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, astima, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclearosis and autolumnume disorders. Subjects that express the inactive receptor have a predisposition, or resistance to HIV-1 and/or HIV-2.
                                                                                                                                                                                                                                                                 Active and inactive forms of human CC chemokine receptor CCR-5 useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 184;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This polypeptide sequence comprises novel human chemokine receptor 86. a 6 protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a conna clone (AAT95161) isolated from a macrophage library. It shows 62% identity to CCCKRI. Chemokine receptor 88-28 (see AAW77114) has also been identified. 88C and 88-28 receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular comprising one or more of the extracellular or intracellular receptor activities particularly ligand and 6 protein binding, and are potentially potentially useful in the treatment of are potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Serves as a correction to infection by macrophage-tropic (M-tropic) strains of HTV-1. The invention relates to the identification of a CCRS variant (see AAM88231), designated CCRSA333, comprising the first two transmembrane domains of wild-type CCRS, our lacking transmembrane domains 3-7. The presence of the CCRSA33 variant with the wild type CCRS allels shows a positive correlation with resistance to infection with M-tropic HTV-1 strains, and may indicate slower progression of the disease. The detection of CCRS variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AIDS. Probes and for detecting the presence of such variants. A method is provided for inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or inhibiting HTV-1 infection of a cell expressing the CCRS or including HTV-1 infection of a cell expressing the CCRS or including HTV-1 infection of a cell expressing the CCRS or including HTV-1 infection of a nucleic acid encoding a CCRS molecules present on the cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LLTIDRYLAVVHAVFALKARTVTFGVVTSVITWVVAVFASLPGIIFTRSQKEGLHYTCSS 180

                                                                                                                                                                                                                                             The invention relates to G protein-coupled receptors (GPCRS) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versalons of known SPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCR.

This invention describes a novel diagnostic agent (A) comprising at least two different ligands (1) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatic), organ rejection, inflammation and autoimmune diseases. Also inhibitors of (1) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowel inflammation), or autoimmune diseases (rheumation arthur or chronic bowel endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    which have cytostatic, antiinflammatory, antiasthmatic, immunosuppressive, dermatological, antirheumatic, antiarthritic. chemokines act on specific tumor and inflammatory cells through a constellation of chemokine receptors (R), which control migration and prolliferation of these cells. AAG80045-AAG80128 represent human chemokine fragments used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 IKSMIDIYLLNLAISDLFFLLTVPFWAHYAAAQWDFGNTMCQLLTGLYFIGFFSGIFFII 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of human HIV-1 co-receptor CCR5.

Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-1

Equipal Aminding site that determines the specificity of the
interaction between CCR5 and HIV-1 spl20. Post-translational
sulfation of the tyrosine residues in the CCR5 N-terminus is
consequent for spl20 binding and may critically modulate the
susceptibility of target cells to HIV-1 infection in vivo. The
invention provides claimed sulfated peptides (see AAB82947) that
control in this consequence of the core of the consequence of the core in this consequence of the consequence of the core of t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Q
```

```
The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10

CC ramellorating a disease or disorder associated with inflammation,

C amellorating a disease or disorder associated with inflammation,

defective or aberrant chemotaxis of immune cells, HIV infection (such as

CC defective or aberrant chemotaxis of immune cells, HIV infection (such as

Debrrant T-cell antigen presenting cell interaction. The disease or

CC disorder may also be an infection, a cytomegalovitus infection such

as an early stage HIV infection, a cytomegalovitus infection such

cc disorder may also be an intection, a cytomegalovitus infection such

as an early stage HIV infection, a cytomegalovitus infection such

cc disorder may be associated

CC disorder may be associated

cc neurodegenerative disorder. The disease or disorder may be associated

with aberrant CCR5 expression, lack of CCR5 function, aberrant CCR5

cis used as a food additive or preservative to increase or decrease

ctorage capabilities. CCR5 HDGNR10 DNA are useful for chromosome

clantibodies, agonists and antagonists are also useful in the

chaquosis, treatment and prevention of cancer (breast, ovary, adrenal

cuogenital); immune disorders (Addison's disease, allergies, autoimmune

cc disease, multiple sclerosis, rheumatoid arthritis and ulcerative

colitis); cardiovascular disorders (myocardial ischaemias) and

asrooma) or defective or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection), an autoimmune disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CCR5 expression, lack of CCR5 function, aberrant CCR5 ingand expression, or lack of CCR5 ligand function. CCR5 HDGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCR5 HDGNR10 DNA are useful for chromosome identification and in gene therapy. CCR5 HDGNR10 DNA, protein, antibodies, agonists and antagonists are also useful in the disposis, treatment and prevention of cancer (breast, overy, adrenal

reporter gene r treatment of

Liu

```
The present invention relates to a transformed mammalian cell that contains a gene encoding CD4, a construct encoding a reporter gene under the regulation of an human immuno deficiency virus (HTV) long terminal repeat (LTR) and that has been transduced with a vector encoding a human chemokine receptor (CRR) where the CD4 and the CKR are present on the cell surface of transformed mammalian cell. The invention is useful for identifying drugs or antibodies that interfere with the transformed ramanian cell of a dentifying a human chemokine receptor that facilitates the infection of a particular HTV strain into the transformed mammalian cell. Compounds chartcular HTV strain into the transformed mammalian cell. Compounds dentified can be used to treat cellular dysfunction and to prevent or combat HTV infection. The present sequence is a human chemokine receptor (CKR), CC-CKR-5 related protein. CC-CKR-5 is the principal cofactor for entry mediated by the envelope glycoproteins of primary macrophage-tropic entry mediated by the envelope glycoproteins of primary macrophage-tropic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LKSMTDIYLLNLAISDLFFLLTVPFWAHYAAAQWDFGNTMCQLLTGLYFIGFFSGIFFII 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for defermining whether an agent is capable of modulating the interaction of chamotactic chamokine receptor 5 (CCR5) with gp120, comprising incubating the agent with CCRS and gp120 and determining whether the agent modulates the interaction, where gp120 and determining whether the agent modulates the interaction, where gp120 is associated with CD4, and where the interaction is a low affinity binding. The method is used to identify an agent capable of modulating the interaction of CCR5 with gp120. An agent identified by the method is used to prepare a pharmaceutical composition for the treatment of a disease or condition associated with CCR5 and gp120 interaction, to treat a subject with a disease or condition associated with CCR5 and gp120 interaction, not for preparing a pharmaceutical for treating human immunodeficiency virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput cores.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LLTIDRYLAVVHAVFALKARTVTFGVVTSVITWVVAVFASLPGIIFTRSQKEGLHYTCSS 180

plasmid, and fragments, analogs and derivatives of the polypeptide. The plasmid, and fragments, analogs and derivatives of the polypeptide. The products of the inventon have autiniflammatory, immunomodulatory, anticollegic, immunosuppressive, vulnerary, cytostatic, anticollegic, immunosuppressive, vulnerary, cytostatic, antiparasitic, anticollegic, immunosuppressive, vulnerary, cytostatic, antiparasitic, anticollegic, broad anticollegic antico This invention describes a novel receptor polypeptide (I) selected from (1) a fully defined 329 amino acid sequence (II) fully disclosed in the specification; and (ii) a polypeptide encoded by the CDNA contained in a Claim la; Page 15; 22pp; English.

Sequence 352 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
